

Coronary Artery Disease (CAD) AI Report

This AI system predicts Coronary Artery Disease using clinical data. It helps in early detection, risk classification, and healthcare decision-making.

Dataset: Heart Disease UCI Dataset

Patients: 303

Features: 16

Target: Heart Disease (0/1)

Key Risk Factors: - Age - Cholesterol - Blood Pressure - Chest Pain Type - ST Depression (oldpeak)

Machine Learning models classify patients into risk categories. This enables early detection and preventive healthcare.

Impact: - Early detection of heart disease - Reduced mortality - Better hospital triage - Improved healthcare planning

This system shifts healthcare from reactive treatment to predictive prevention.
